

There are 3 main features of my product, which I must clearly define, to allow for the next phase of the project, meaning a seamless integration between ideating and creating(mainly based on how it will work):

1. Average: The program will collect an RSS feed from both a radical left wing provider, as well as a radical right wing provider. One both RSS feed have been cleaned, AI will be utilized to combine the 2 articles, hopefully neutralizing each other's bias, and only keeping the factual information. This is a proven method to work scientifically, and can be created using some simple algorithms.
2. Feedback: The program is open-source, meaning multiple people can try it out(if they are technical and willing), and provide feedback to the AI, curating a perfect article according to the objectivity of it. This relates to the social theory of the community providing to the community, and is a great mode for building small-scale starting projects.
3. Publish: Once the article is approved by most of the curators, it can undergo a short re-review, and be published there-after, giving the general public access to the truthful version of the article, and thus solving the problem statement.
